

#linear\_algebra

$$A^{-1}A = I \quad \text{and} \quad AA^{-1} = I$$

A matrix that is not invertible is sometimes called a **singular matrix**, and an invertible matrix is called a **nonsingular matrix**

---

#### THEOREM 4

Let  $A = \begin{bmatrix} a & b \\ c & d \end{bmatrix}$ . If  $ad - bc \neq 0$ , then  $A$  is invertible and

$$A^{-1} = \frac{1}{ad - bc} \begin{bmatrix} d & -b \\ -c & a \end{bmatrix}$$

If  $ad - bc = 0$ , then  $A$  is not invertible.

$ad - bc$  is called the **determinant** of  $A$ , and we write

$$\det A = ad - bc$$

---

#### THEOREM 5

If  $A$  is an invertible  $n \times n$  matrix, then for each  $\mathbf{b}$  in  $\mathbb{R}^n$ , the equation  $A\mathbf{x} = \mathbf{b}$  has the unique solution  $\mathbf{x} = A^{-1}\mathbf{b}$ .

---

## THEOREM 6

a. If  $A$  is an invertible matrix, then  $A^{-1}$  is invertible and

$$(A^{-1})^{-1} = A$$

b. If  $A$  and  $B$  are  $n \times n$  invertible matrices, then so is  $AB$ , and the inverse of  $AB$  is the product of the inverses of  $A$  and  $B$  in the reverse order. That is,

$$(AB)^{-1} = B^{-1}A^{-1}$$

c. If  $A$  is an invertible matrix, then so is  $A^T$ , and the inverse of  $A^T$  is the transpose of  $A^{-1}$ . That is,

$$(A^T)^{-1} = (A^{-1})^T$$

The product of  $n \times n$  invertible matrices is invertible, and the inverse is the product of their inverses in the reverse order.

---

There is an important connection between invertible matrices and row operations that leads to a method for computing inverses. As we shall see, an invertible matrix  $A$  is row equivalent to an identity matrix, and we can find  $A^{-1}$  by watching the row reduction of  $A$  to  $I$ .

---

Each elementary matrix  $E$  is invertible. The inverse of  $E$  is the elementary matrix of the same type that transforms  $E$  back to  $I$ .

**EXAMPLE 6** Find the inverse of  $E_1 = \begin{bmatrix} 1 & 0 & 0 \\ 0 & 1 & 0 \\ -4 & 0 & 1 \end{bmatrix}$ .

**SOLUTION** To transform  $E_1$  into  $I$ , add  $+4$  times row 1 to row 3. The elementary matrix that does this is

$$E_1^{-1} = \begin{bmatrix} 1 & 0 & 0 \\ 0 & 1 & 0 \\ +4 & 0 & 1 \end{bmatrix} \quad \blacksquare$$

The following theorem provides the best way to “visualize” an invertible matrix, and the theorem leads immediately to a method for finding the inverse of a matrix.

### THEOREM 7

An  $n \times n$  matrix  $A$  is invertible if and only if  $A$  is row equivalent to  $I_n$ , and in this case, any sequence of elementary row operations that reduces  $A$  to  $I_n$  also transforms  $I_n$  into  $A^{-1}$ .

**PROOF** Suppose  $A$  is row equivalent to  $I_n$ . Then there is a sequence of elementary row operations that transforms  $A$  into  $I_n$ . Let  $E_1, E_2, \dots, E_k$  be the elementary matrices that perform these operations in sequence. Then

$$E_k \cdots E_2 E_1 A = I_n \quad \text{and} \quad E_k \cdots E_2 E_1 I_n = A^{-1}.$$

Thus,  $A$  is invertible, and the inverse of  $A$  is  $E_k \cdots E_2 E_1$ .  $\square$
